

AC Presents 2 New Pieces

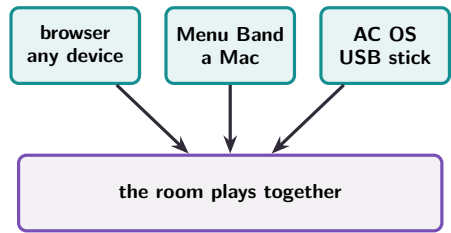

Technical rider · CultureHub LA

Sat Sep 19, 2:00–3:30 p.m. Grokaesthetic Workshop. Free, open to anyone. **Thu Sep 24, 7:00 p.m.** Piece 1, the swap, Piece 2, then talking, then everyone plays. Thursday is set. Saturday isn't — I cut the guest set, which was half the argument for two nights. Tell me which you want and I'll re-cut the program.

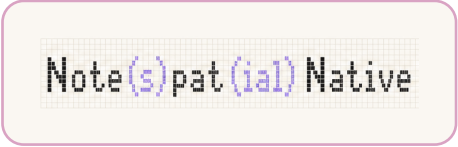

Event one · Saturday

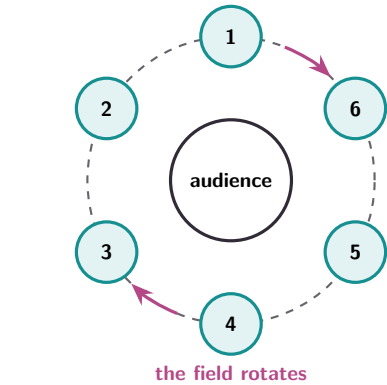

Bring a computer, leave playing one.

Piece 1 · Thursday

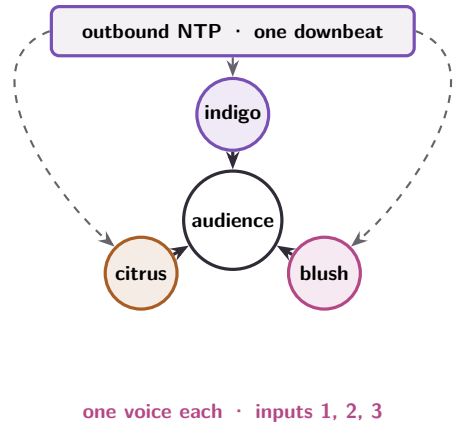

Six laptops. The sound moves around the room. The laptops don't.

Piece 2 · Thursday

Three laptops that were never cabled together, hitting one downbeat.

SYSTEM REQUIREMENTS

- **Network** — guest Wi-Fi for 25–35 devices, and it has to allow **app downloads**. Without them nobody installs Menu Band and a third of the room is out.
- **Permissions** — people can boot their own laptops off my USB sticks. Nothing touches their disks.
- **Power** — strips at the seating for about 20 laptops. Nobody arrives charged.
- **Audio** — stereo is enough. Surround if it's free that afternoon.
- **Room** — seating where people face each other, not a stage. A mic, or a quiet room. Somewhere to put my loaners.
- **Catering** — snacks and a bin. People stay when there's food.

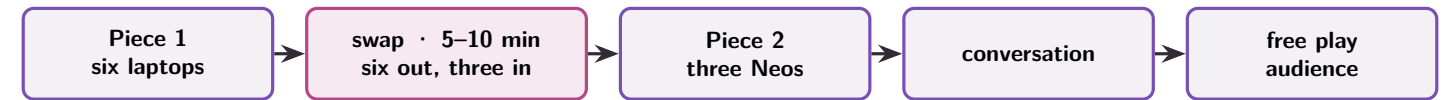

SYSTEM REQUIREMENTS

- **Machines** — six surplus laptops running AC OS off USB, plus my control laptop. I bring all of it and two spares.
- **Audio** — **six discrete inputs** to the Kalio, off an interface with six line outs. DI and cable to match.
- **Sixth channel** — tell me if it's full-range or LFE-only. If LFE-only I build the field from five and send it low end.
- **Network** — a switch of my own, off the public traffic.
- **Power, space, video** — seven outlets, six low tables around the audience, and a projector I can reach with HDMI.
- **Won't work as** — six fixed voices. The sound moves, so nothing gets hard-patched.

SYSTEM REQUIREMENTS

- **Machines** — three MacBook Neos on macOS with the score already loaded. Mine.
- **Audio** — **three full-range positions** in as wide a triangle as the room allows. Indigo, citrus, blush to inputs 1, 2, 3.
- **Network** — **outbound NTP has to work**. No cable, no timecode — the machines agree by clock. Block it and the downbeat smears.
- **Control** — I conduct over ssh if clients can see each other. If not I arm them by hand — tell me before the rehearsal.
- **Power and space** — three outlets, three steady surfaces.
- **Doesn't use** — USB boot. These are Apple silicon and AC OS is x86_64, so don't plan on it.

The evening

I take six machines off and put three on, in front of everyone. The guest set used to hide that, and I cut the guest. Give it five to ten minutes and tell me what the room should be doing while it happens — house lights and talking is fine, or I leave a drone running, or the score goes up on the projector. Six line outs are enough if we can repatch mid-show. Nine if we can't. Afterward people play the instruments themselves, so don't strike anything until the room empties.

WHAT I NEED FROM YOU

- Your Kalio layout, and whether the sixth channel is full-range. Six discrete inputs, or does it want a house spatializer? **Can we repatch during the swap, or do I need nine paths?**
- Does the network allow **outbound NTP**, can clients reach each other over ssh, and does guest Wi-Fi allow **app downloads**? **Can people boot from USB in the space?**
- **Saturday the 19th, or fold it into the 24th?** Everything else — projector specs, load-in hours, who keeps the archive — I'll settle with you over email.
