Playable Folk Songs

Oral Tradition Meets the Browser Keyboard on notepat.com

[**working draft — not for citation**]

Abstract. Folk songs evolved to be playable without notation, memorizable without instruments, and forkable without permission. These properties—constrained pitch range, repetitive structure, oral transmissibility—make folk melodies structurally ideal for notepat.com, a browser-based chromatic keyboard synthesizer built inside Aesthetic.Computer (**?**).

I encode folk melodies in a lightweight `NOTE:word` format that pairs each pitch with its lyric syllable, creating a guided performance mode where the instrument teaches the song one note at a time. The encoding is URL-safe, human-readable, and forkable—copy it, change a note, share a new link. The "oral tradition" becomes a tradition of hyperlinks.

I survey folk melody collections from American, European, East Asian, and African traditions, analyze why their structural constraints align with keyboard-as-instrument interfaces (**?**), and describe how notepat runs on bare metal via AC Native OS (**?**)—a surplus laptop that boots directly into a folk instrument. The cards format of this paper (4×6 inch, phone-sized) is itself a playable artifact: each song encoding is a tappable URL.

1. THE ARGUMENT

Folk songs are humanity's oldest open-source software.

They have no single author. They are maintained by a community. They are transmitted orally—meaning they must be simple enough to memorize, constrained enough to reproduce, and flexible enough to adapt. Every singer is a contributor; every performance is a fork.

These are exactly the properties that make a melody playable on a QWERTY keyboard.

bare metal is, in a literal sense, a folk instrument: a single-purpose device for playing songs, with no desktop environment, no app store, no distractions.

The boot sequence: power on, kernel loads (7.3 seconds), the screen says "hi @alice," and notepat is playing. The student's name is spoken aloud by text-to-speech. The keyboard lights up with the first note of the song. There is nothing else to do, nowhere else to go. The laptop is the instrument.

8.1 Why Bare Metal Matters for Folk Songs

The PLOrk model (**?**) required custom hardware: hemispherical speakers, audio interfaces, dedicated laptops. The cost was prohibitive for most schools. AC Native OS inverts this: it runs on surplus commodity hardware—retired corporate laptops available for $30–80—and transforms them into single-purpose instruments.

A classroom of 30 bare-metal notepat devices, each loaded with a different folk song from a different tradition, is a folk orchestra. Each student learns their song, then the class performs together. The Korean student plays Arirang. The American student plays Amazing Grace. The Japanese student plays Sakura. The instruments are identical; the songs are culturally specific; the ensemble is global.

This is the scenario described in the companion paper on laptop orchestras (**?**)—but applied specifically to folk music, where the repertoire is public domain, culturally significant, and structurally suited to the instrument.

8.2 Offline Operation

The bare-metal notepat requires no internet connection. Songs can be pre-loaded on the boot partition in `config.json`. A teacher prepares a USB drive with a set of folk songs, flashes it onto 30 laptops, and the classroom is ready. No WiFi, no accounts, no cloud services. The song files are kilobytes. The entire OS is 89 MB.

This matters for the contexts where folk music education is most needed: schools without reliable internet, community centers without IT support, rural areas without broadband. The folk song and the folk instrument share a design constraint: they must work with what is available.

9. FUTURE WORK

- **Crowdsourced encoding**: A public repository of `NOTE:word` encodings, submitted as URLs, versioned like folk songs themselves.
- **Cross-cultural collections**: Encoding melodies from the Essen, Roud, and Lomax archives into notepat format, with permission and attribution.
- **Adaptive difficulty**: Expanding pitch range as the player masters simpler songs—a Kodály-like progression through the folk repertoire.
- **Multiplayer folk sessions**: Two notepat players on the same song, one playing melody, one playing harmony—a digital *session* in the Irish traditional sense.
- **Recording and sharing**: Capture a performance as audio, pair it with the encoding URL, and post it—an oral tradition with receipts.

10. CONCLUSION

Folk songs survived centuries without notation, without recording, without instruments. They survived because they were simple enough to remember, flexible enough to adapt, and valuable enough to share.

A browser keyboard that teaches these songs one note at a time is not a departure from the folk tradition. It *is* the folk tradition—adapted, once more, to the instrument at hand.
