[working draft — not for citation]

Abstract. This paper traces the complete technical evolution of Aesthetic.Computer (AC) through its git history, from a Glitch-hosted prototype in August 2021 to an 11,314-commit monorepo serving 337 interactive pieces. By examining four successive repositories, 50+ GitHub repos across two accounts, a 109 GB legacy server archive, and a Dropbox archive spanning a decade of creative software practice, we reconstruct how a single artist-programmer’s tools, prototypes, and creative instruments converged into a unified platform. The investigation reveals 94 predecessor projects (2007–2020) that directly inform AC’s design philosophy: that software is a material for art-making, and that each tool an artist builds is a step toward a more complete instrument.

1. THE FOUR REPOSITORIES

Aesthetic.Computer did not begin as a monorepo. It evolved through four successive GitHub repositories, each representing a distinct architectural phase:

Metric	Value
Successive repositories	4
Total commits (current)	11,314
Months of development	38
Predecessor projects	94

1.1 system-ac (Aug–Dec 2021)

`whistlegraph/system-ac` — “*My virtual computer system for loading and running disks.*”

The first commit was made on August 10, 2021 and immediately merged from Glitch [Fog Creek Software, 2017], revealing that AC began as a Glitch remix. The repository contains 38 commits over four months, authored variously as “@jeffrey,” “Jeffrey Scudder,” and “whistlegraph” — a trace of the identity consolidation happening in parallel with the code.

The initial architecture was minimal: a single `boot.js` entry point, a `bios.js` runtime, and a library of modules including `disk.js`, `geo.js`, `graph.js`, `pen.js`, `speaker.js`, and a sound system with sine and square wave generators. The metaphor was already established: a computer that loads and runs *disks*.

Key milestones: basic metronome and square instru-

ment (Aug 18), triangle rasterization and 3D environment (Oct 20), first animated notation piece (Oct 30), pen refactored from singleton to class (Nov 28) — a pivotal API design decision. The dev server ran on port 8080 with self-signed SSL certs; HTTPS was required from day one, likely for WebRTC and audio APIs.

1.2 disks-ac (Oct–Dec 2021)

`whistlegraph/disks-ac` — “*A bunch of disks that are compatible with the ‘whistlegraph/system’ repo.*”

This companion repository held creative content separately from the runtime. Its `package.json` reveals the coupling: “system”: “file:../system” — the disks imported system as a local dependency. The dev server ran on port 8081, one above system.

The 12 original disks represent AC’s founding creative vocabulary: `prompt.js` (command-line text input — the system’s front door), `doodle.js` (free drawing), `plot.js` (grid-based pixel plotting), `pull.js` (touch-interactive shapes), `stage.js` (musical notation), `starfield.js` (generative animation), `tracker.js` (scrollable sequencer), `whistlegraph.js` (Whistlegraph playback), and four utility/test disks. Also preserved: `old/worker-disk.js` — evidence that a Web Worker-based disk execution model was attempted and abandoned early.

1.3 2022.aesthetic.computer (Dec 2021–Dec 2022)

`whistlegraph/2022.aesthetic.computer` — “*Compute aesthetically.*”

On December 22, 2021, the system and disks repos were merged: *“import sources from previous repositories,”* followed immediately by *“rm disks duplicates.”* This was the first monorepo. The tagline changed from a technical description to a creative imperative.

This year-long repository captures AC’s transformation from a personal instrument into a platform:

- **Jan 2, 2022:** “Start working on a spray drawing tool for iPad & Apple Pencil.” Same day: “Add iOS / macOS native shim.”
- **Jan 5:** “Get a basic IPFS demo working” — Web3/decentralized storage explored early.
- **Jan 7:** “Consolidate disks into system” — the two-repo architecture was already a friction point after 2 weeks.
- **Jan 10:** “Begin working on prompt, wiring up the keyboard.”
- **Jan 11:** “Hook up microphone and start code path for video.”
- **Oct 2022:** Hypervisor revamp — pieces can now transition instantly without page refresh.
- **Oct 24:** “Meta Quest 2 keyboard updates / more HID work” — VR headset support.
- **Nov 2022:** VR integration: “cadwand vr hello world,” 3D wand tool, GLTF/GLB export.
- **Dec 2022:** “Complete ethereum login / connect flow.” Session server with Jamssocket backends.

By year’s end the tree included: `system/` (Netlify), `session-server/` (Jamssocket), `socket-server/`, `piece-server/`, `thumbnail-server/`, `stream/`, `storage/`, `apple/` (iOS/macOS shim), `ethereum/`, and `digitpain.com/`.

1.4 aesthetic-computer (Dec 2022–present)

The current repository. First commit: *“Initial commit.”* Second: *“copy all previous sources into the new repo; todos.”* Third: *“first netlify deploy.”* Three commits in 35 minutes on December 23, 2022 — a fresh start on the same day the previous repo received its final commit.

As of March 2026: **11,314 commits** across 38 months.

Feature	First appearance
Auth (Auth0)	Jan 5, 2023
Session server	Jan 21, 2023
KidLisp	~Feb 2023
Multiplayer	~Mar 2023
Tezos/NFT → “keep”	~2023
notepat	~2023
Mobile camera	Jan 2023

Table 1: Feature first appearances in the current repository.

2. THE PREDECESSOR PROJECTS

AC did not emerge from nothing. Cross-referencing two GitHub accounts (whistlegraph with 50+ repos and justanothersystem with 3 repos), a Dropbox archive, a 109 GB legacy DigitalOcean droplet, and the author’s CV, we identify **94 predecessor projects** spanning 2007–2020.

2.1 The Drawing Software Lineage

AC is, at its core, a drawing program. The lineage:

- **thePRBAT** (2011) — Polygon Replicating Bitmap Authoring Tool. Flash/SWF. BFA thesis tool at Ringling College.
- **JeffreyPaint** (2014) — “My paint program.” JavaScript web app + Unity port + macOS .dmg.
- **No Paint** (2014–2020) — “A picture-making instrument.” The constraint: you can only paint, never erase. Five incarnations across six years: Rails app → JS shim → WebGL prototype → iOS/Cordova → Vercel site. Six repos.
- **Mood Engine** (2015) — Native C application. “Maskware’s MOOD Engine.”
- **Traveller** (2015) — Processing → 3 standalone macOS .app builds.
- **Finger Quilt** (2016) — iOS app in Swift. Quilting-as-drawing.
- **Dot** (2017) — “A dot plotting application.” Directly prefigures AC’s `plot` disk.

The author also maintained a curated directory of web-based drawing tools (2017, hosted on Glitch as `weird-drawing-tools.glitch.me`) — a research document cataloging dozens of drawing programs. This catalog represents the conscious study of drawing-software-as-medium that informed AC’s design.

2.2 The Performance Software Lineage

AC’s real-time, multiplayer, and performance features trace to tools built for the Radical Digital Painting lecture tour and Goodiepal & Pals collaborations:

- **Peter** (2017) — A web app allowing audience members to upload expiring images for Julia Yerger to paint with. Real-time audience participation.
- **border-notation** (2017) — Border animation notation program for GP&PLS. Music notation in the browser.
- **pmet-subs** (2017) — Real-time subtitle display for Goodiepal performance.
- **Shutter Rub** (2018) — Tool for Knoth & Renner at Fikra Design Biennial.
- **pic.jeffreyheart89.com** (2017) — “Digital painting delivery service.”

2.3 The Infrastructure Lineage

Even AC’s infrastructure has predecessors:

- **live** (2016) — “Reloads browser automatically.” A Ruby live-reload server. AC’s current hot-reload WebSocket system is the descendant.
- **cfig** (2013) — VimL dotfiles from Yale MFA era. The first configuration-as-practice.
- **netlify-functions-headless-chrome** (2022) — Headless Chrome screenshots on Netlify. Direct precursor to the oven screenshot service.
- **giphy-upload-proxy** (2017) — Server-side media processing experience.

2.4 Languages Across Projects

The predecessor projects span an unusual range for a single practitioner: JavaScript (dominant), Ruby (Rails era), Swift (iOS), Java (Android), C (Mood Engine), Rust (Rect), VimL (dotfiles), Processing (Traveller), Flash/ActionScript (thePRBAT), Lua (PICO-8), and TypeScript. AC consolidates this polyglot history into a JavaScript-first platform with KidLisp [Jeffrey, 2026a] as its embedded language.

3. ARCHITECTURAL PATTERNS

3.1 The Disk/Piece Metaphor

From the first `system-ac` commit, the metaphor was “disks” loaded by a “system” with a “bios.” This metaphor — borrowed from personal computing history — persists through all four repos. The rename from “disk” to “piece” happened during the 2022 period, aligning the technical term with the artistic one. A piece of software. A piece of music. A piece of art. The implications of this renaming are explored in a companion paper [Jeffrey, 2026b].

3.2 The Prompt as Interface

The prompt — a blinking text cursor where users type piece names — appears in the very first `disks-ac` repo as `prompt.js`. It later became `notepad`’s keyboard and AC’s primary navigation system. The prompt is not a command line; it is a *musical* interface, where typing a word like `notepad` is an act of recall and invocation, like humming a melody to find a song.

3.3 Two-Repo to Monorepo

The `system/disks` split lasted exactly 4 months before being merged. The split reflected a conceptual distinction (runtime vs. content) that proved impractical. The merge happened twice more: into `2022.aesthetic.computer` and then into the current repo. Each consolidation discarded git history in favor of a clean start — a deliberate choice to prioritize forward momentum over archaeological continuity, which is precisely what makes this reconstruction necessary.

Metric	Count
Predecessor projects (2007–2020)	94
GitHub repos (whistlegraph + JAS)	50+
.mjs pieces in current repo	337
.lisp pieces (KidLisp)	18
Library modules	76
Netlify serverless functions	83
Backend services	5
Legacy archive size	109 GB

Table 2: Quantitative overview of the AC ecosystem.

4. QUANTITATIVE SUMMARY

5. CONCLUSION

Aesthetic.Computer is not a project that began on August 10, 2021. It is the convergence of a decade of creative software practice — from thePRBAT (2011) through No Paint’s five incarnations (2014–2020), through performance tools for Goodiepal & Pals, through a curated catalog of every web-based drawing tool the author could find, through a Rust rectangle game and a PICO-8 drawing cart and a Pebble smart-watch experiment, through 65+ lecture performances on the thesis that digital tools are painting’s next material ground.

The git history reveals what manifestos cannot: the daily accumulation of decisions, the abandoned paths (`worker-disk.js`, the two-repo split), the convergences (`system + disks` → `monorepo`), and the renames that carry meaning (`disk` → `piece`, `notepad` → `notepat`, `NFT` → `keep`). Every commit is a brushstroke in the longest painting @Jeffrey has ever made.

“Something composed in 30 minutes (like a whistlegraph!) could live for an eternity.”

— @Jeffrey, Personal Statement: Core Beliefs

Sources. GitHub: `whistlegraph/system-ac` (38 commits), `whistlegraph/disks-ac` (30 commits), `whistlegraph/2022.aesthetic.computer` (~500 commits), `whistlegraph/aesthetic.computer` (11,314 commits). 50+ additional repos across `whistlegraph` and `justanothersystem` accounts. Legacy server: `bin-sc.jas.life`. Dropbox archive. CV and fact-check report.
