

The Pals Mark

A History of the Aesthetic.Computer Logo

@jeffrey · Aesthetic.Computer · logo by Niki Stebbins · ORCID 0009-0007-4460-4913

EN · DA · ES · ZH · JA · RU

Abstract. The Pals are the logo of Aesthetic.Computer: two hand-drawn figures holding hands with their arms raised. This paper tells how the mark was made — commissioned from the artist Niki Stebbins and drawn, over the summer of 2023, *inside* Aesthetic.Computer using its own `wgr` whistlegraph tool — and how it then became infrastructure: a rotating `pals.aesthetic.computer` “logo grabber” that serves the mark’s many poses across avatars, papers, native OS, and the web, each one a link back to the project.

1. WHAT Aesthetic.Computer IS

Aesthetic.Computer is a mobile-first runtime and social network for creative computing — a single URL bar that doubles as a musical-instrument-like interface, where memorable commands summon interactive programs called “pieces.” It supports both JavaScript (`.mjs`) and a homegrown Lisp dialect, **KidLisp** (118 built-ins). The whole system speaks to pieces through one core API (`disk.mjs`, ~600 KB).

When it went online. The `aesthetic.computer` domain has been held since **2013-12-12**. The platform as it exists was conceived out of *No Paint* (2020), development began in **2021**, and it has deployed continu-

ously from the current repository since **December 2022** (~20,300 commits).

Platform statistics (live, July 7, 2026):

- ~400 built-in pieces in-repo (383 `.mjs` + 20 `.lisp`); 265 user-published works.
- **17,538** KidLisp programs stored in production — a growing corpus of community-authored generative art.
- ATPROTO / Bluesky federation; per-handle record collections (paintings, moods, pieces, KidLisp) on the `at://` network.

Who it serves, and who knows the mark. Aes-

thetic.Computer’s users are a community of creative coders, artists, and non-technical “Pals” who publish instantly under `@handle` pieces. The platform engages a broad readership across the art-and-technology field, and Aesthetic.Computer works have entered institutional collections. The Pals mark itself rides every one of these surfaces: the boot screen, the papers, the social avatars, the native OS. Its conceptual lineage in the radical-computer-music community of *Goodiepal & Pals* (see the lineage section below) gives the name a recognized history in media art beyond Aesthetic.Computer’s own audience.

2. WHAT THE MARK DEPICTS

The Pals logo is **two outlined human figures holding hands with their arms raised** — like two friends walking or dancing together — rendered in a loose, organic, hand-drawn line. The canonical static vector (`system/public/purple-pals.svg`) is pink/magenta, `#cd5c9b`. It is *not* “a pair of eyes,” an earlier misreading that has since been corrected in the paper stack.

Crucially, the mark was made *with* the platform, not merely *for* it: Niki drew the logo explorations using `wgr`, the whistlegraph-renderer drawing piece that runs inside Aesthetic.Computer itself. The logo is therefore both an identity and a demonstration of the tool.

3. HOW THE MARK WAS MADE

3.1 A stamp, first

It starts in the summer of **2020** with a small gift. Niki Stebbins emails a drawing — a little purple star — and Jeffrey drops it into the game as a stamp under the handle `@niki` and asks for more. For the next two years the collaboration is a loose, ongoing *drawing session*: stamps, a drawing game, whistlegraph doodles. By **2022** it is paid design work. None of it is the logo yet, but it is the soil the logo grows from — a habit of two people drawing together inside the tool.

3.2 Reopening the design (June 2023)

The logo proper begins with dissatisfaction. In **June 2023** Niki writes that she is “not 100% satisfied with the logo I left you with,” and reopens it. She thinks out loud about color — “like purple or green... not blue, too many blue app logos” — and about form: should the mark be “like a frame, a closed shape only,” something you could work *inside*? She sends a sketchbook page of candidates and picks a favorite — “I like the circled one the most” — then immediately worries it is “pretty similar to are.na’s logo,” and keeps going. The key instruction she gives herself is a correction of proportion: push it “so it looks less like stars and more like figures.” A page of the studies gets a verdict of its own — “looks like starfish lol”

— and to fix it she leaves the screen entirely, tying and photographing lengths of **rope** in a park to understand how two linked bodies actually fall.

3.3 Building the two figures (July–August 2023)

Through the summer the mark resolves into *two* figures rather than one. Niki buys a used **Kodak EasyShare** digital camera specifically to photograph the logo, sizes a version to “the exact size of the VS Marketplace logo,” and asks whether Jeffrey wants “more logo drawings in a.c for social media pfp’s and the app-store thing.” The repository agrees with the messages: on `5bcefc5a9`, “better defaults in `wgr` for niki’s logo efforts” the drawing tool itself is tuned for her, and by `a0009f5d0`, “add new vscode extension logo from niki” a shipped asset lands. Late August she reports the “variations of the **two logos**” finished, describing the gesture precisely — “the right figure was pulling at the left one... the left figure’s arm is higher.” The mark is now the thing it still is: two people, arms up, one pulling the other along. On **2023-08-31** an Instagram profile picture is chosen.

3.4 Ice cream, and going live (September 2023)

The finish is the strangest and best part. To photograph the mark in the world, Niki draws it at full size on pavement and tries to shoot it with ice cream — but the ballpark ice cream comes in cups, so she detours to a McDonald’s for a cone and gets the shot. On **2023-09-09** she “sent the logos to a.c email” under the subject `!c3 cr34m l0go$` (body: “ice cream logos 8”). That same week the mark stops being a picture and becomes infrastructure: `0aba1a378`, “add dynamic logo generator” lands, and Jeffrey reports back the one-line result — “^ will now return a random logo every time.” The logo was drawn *with* the platform (in the `wgr` whistlegraph tool) and then served *by* it. It was never only a picture; it was always also a program.

4. THE ENDPOINT: PALS.AESTHETIC.COMPUTER

The mark became infrastructure in September 2023, when Aesthetic.Computer stood up a dedicated logo service and gave it a memorable home.

- **2023-09-05** — `0aba1a378`, “add dynamic logo generator”. The backend module `system/backend/logo.mjs` is stamped 23.09.05.22.31.
- **2023-09-12** — `f1a4f272c`, “logo -> `pals.aesthetic`” — the route is renamed to the Pals identity.
- **2023-09-13** — `12e348035`, “`pals.aesthetic.computer url fix`” — the endpoint is live and addressable at its own subdomain.

So `pals.aesthetic.computer` went online on **2023-09-12–13**, three days after the dynamic generator landed.

4.1 How it works as a “logo grabber”

The endpoint is a tiny rotating proxy, not a single fixed image. Each request returns a different Pals pose:

1. `pals.aesthetic.computer` redirects (via `system/netlify.toml`) to `aesthetic.computer/api/logo`.
2. `system/backend/logo.mjs` holds a list of Pals *paintings* on the `pals-aesthetic-computer` CDN bucket and returns a random one each call (avoiding an immediate repeat).
3. The function `content-negotiates`: a browser gets a full-bleed HTML page on a random purple, tappable to cycle to the next pose (passing `?previousLogo=` so it never repeats); a `curl/<img>/server` request gets the raw `.png` directly. The same URL is thus both a viewer and a hot-linkable asset.

4.2 The many poses of the Pals

The grabber’s pose set is a gallery of `wgr` paintings from mid-2023 (the `painting-2023.7.29-2023.8.21` series). Because the logo is a *collection of drawn poses* rather than one frozen glyph, the brand reads as alive: every page load, avatar refresh, or favicon fetch can show the two figures in a slightly different stance. The full set of twelve live poses is reproduced in Appendix A.

5. USE ACROSS PROPERTIES

Because any property can hot-link `pals.aesthetic.computer` (or embed the static `system/public/purple-pals.svg`), a single mark threads the whole ecosystem, and every instance is a link back to the project:

- **Social avatars & Gravatar** — the rotating endpoint supplies a profile image that quietly changes pose, so the same identity appears across services while always resolving to Aesthetic.Computer.
- **Web & marketing** — favicons, docs headers, and embedded `<img>` tags pull the live Pals; a tap cycles poses, turning the logo itself into a small interactive teaser for the platform.
- **Papers** — the Pals ride the margins of every Aesthetic.Computer working draft as semi-opaque, page-wiggling side-stamps (see this page), and appear in print-edition colophons.
- **Native OS & desktop** — the Pals serve as boot branding (Plymouth splash) in AC Native OS and as the vector tray icon in AC Electron and MenuBand — accent-tinted, badge-able.
- **Print (pending)** — in May 2025 Jeffrey contacted Casey Rubber Stamps to cut physical Pals stamps in three sizes; the order stalled and was never completed.

6. WHY “Pals”? THE GOODIEPAL LINEAGE

The name is not decoration; it is a structural claim, and its weight comes from outside Aesthetic.Computer. As argued in the Aesthetic.Computer paper *Radical Computer Art: Goodiepalian Approaches in Aesthetic Computer* (`papers/arxiv-goodiepal/goodiepal.tex`) and the platform paper it cites, “Pals” descends from **Goodiepal & Pals** — the loose affinity group around the Danish-Faroese musician and Radical Computer Music theorist Goodiepal (Gaeoudji SYGNOK, b. 1974).

The Pals model is a politics of organization: a group with no membership, no institutional backing, and no formal structure, held together by shared practice and mutual recognition rather than affiliation. Goodiepal taught History and Aesthetics of Electronic Music at the Royal Danish Academy of Music and left in 2008 after a conflict described as having “the wrong type of friends,” having declared “intellectual war against the stupidity in modern computer music and media art.” Jeffrey toured with Goodiepal & Pals across Europe in 2018, and the tools built for those performances are direct ancestors of Aesthetic.Computer’s architecture.

So the logo carries that media-arts political history into the brand. As the Goodiepal paper puts it, naming the logo “Pals” — and titling the score *Score for Aesthetic.Computer & Pals* — “is not branding; it is a structural claim: the platform belongs to its community of practitioners, not to its developer or its investors.” Two figures holding hands, made *inside* the tool, is the argument rendered as a mark: Aesthetic.Computer is *for* anyone who shows up — for Pals.

7. AUTHORSHIP

Jeffrey hired **Niki Stebbins** to design the Aesthetic.Computer logo under his direction. Across 2022–2023 she developed the mark inside the platform’s own `wgr` drawing tool, working through the sketchbook, rope, and ice-cream explorations documented above and delivering the two-figures device that ships as `purple-pals.svg`. The rotating `pals.aesthetic.computer` grabber went live on 2023-09-12–13; the canonical static vector first appears on 2024-01-31 (`bf29eadf8`, “*host purple-pals graphic for docs*”); and from 2026-02 the repository and papers explicitly center “Pals” as platform identity (`48dd8923e`, “*rename score to “Score for Aesthetic.Computer & Pals”*”). The mark is a commissioned work: authored by Niki, directed by Jeffrey, and owned by Aesthetic.Computer.

Sources: repository commit history; `system/backend/logo.mjs`; `system/netlify/functions/logo.js`; `system/netlify.toml`; `papers/arxiv-goodiepal/goodiepal.tex`; `system/public/purple-pals.svg`.

Note on dates. Every visual asset below is captioned with the date it was made: `wgr` poses by the timestamp encoded in the painting slug; `monorepo` assets by their first-commit (`git --diff-filter=A`) date; live captures by the date they were photographed from production.

APPENDIX A — THE MANY POSES (LIVE `PALS.AESTHETIC.COMPUTER` SET)

The twelve `wgr` paintings the logo grabber rotates through, pulled live from the `pals-aesthetic-computer` CDN. Same two-figure motif, each a different stance and color treatment.

APPENDIX B — THE MARK ACROSS THE MONOREPO

The same Pals drawn once and re-skinned everywhere: the canonical vector and its descendants across the codebase — editor extension, native-OS boot splash, desktop tray, pop covers, invoice stamp, and the keymaps colorway set. Each tile is captioned with its first-commit date.

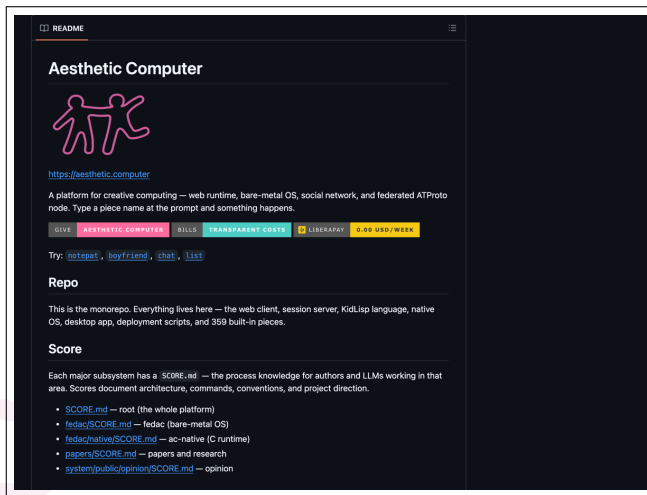

APPENDIX C — LIVE PLACEMENTS (REAL UIS)

The Pals photographed living in real production interfaces, each captioned with its source URL (links are live): the Visual Studio Marketplace listing (the Pals as the extension's product icon), the monorepo README on both GitHub and the canonical Tangled host, and the rotating pals.aesthetic.computer endpoint (same URL, different poses on reload — plus the raw `/api/logo.png` handed to `<img>` tags and avatars).

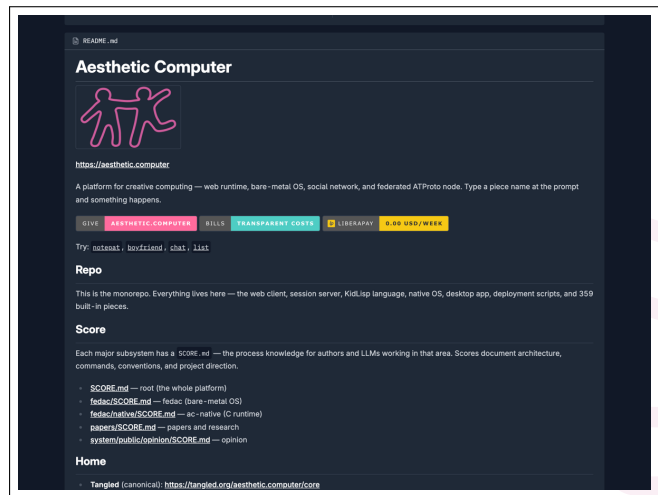

Visual Studio Marketplace — the Pals as the product icon of the official Aesthetic.Computer VS Code extension (1,201 installs).

<https://marketplace.visualstudio.com/items?itemName=aesthetic-computer.aesthetic-computer-code>

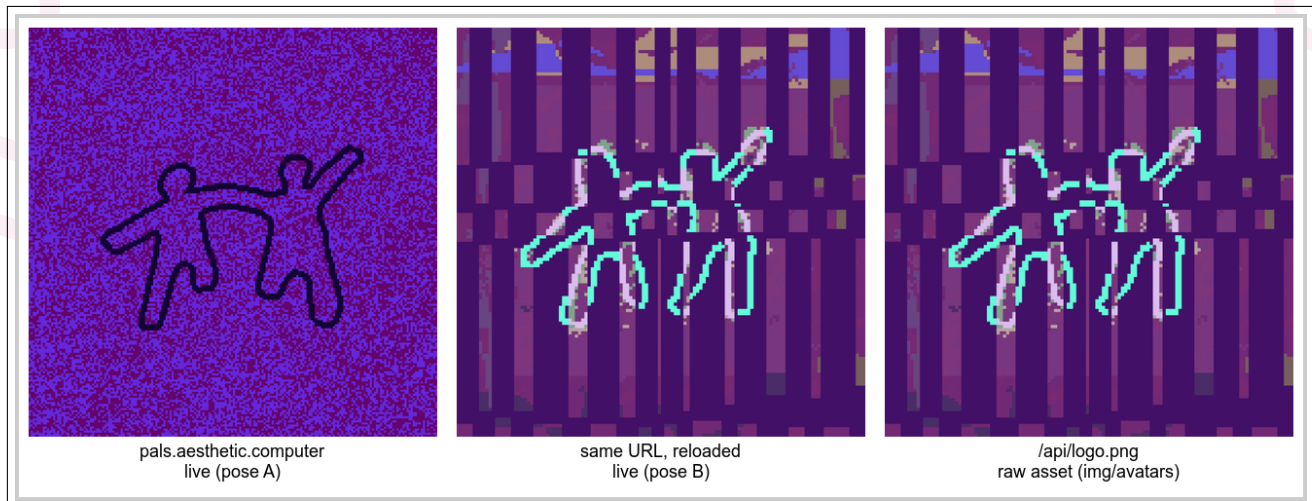

GitHub — the Pals atop the monorepo README.

<https://github.com/whistlegraph/aesthetic-computer>

Tangled (canonical git host) — the same README, same mark.

<https://tangled.org/aesthetic.computer/core>

pals.aesthetic.computer in a live browser — the same URL reloaded shows different poses (the rotating “logo grabber”); the raw `/api/logo.png` is what `<img>` tags and avatars (Gravatar, social) fetch across the web.
